

# makeLeafletTiles

*Eliot McIntire and Alex M Chubaty*

*18 May 2018*

## Overview

Provide an overview of what the module does / how to use the module.

Module documentation should be written so that others can use your module. This is a template for module documentation, and should be changed to reflect your module.

## R Markdown

R Markdown syntax allows R code, outputs, and figures to be rendered in the documentation.

For help writing in R Markdown, see <http://rmarkdown.rstudio.com/>.

## Usage

```
library(SpaDES)

setPaths(modulePath = file.path("C:/Eliot/GitHub/LandWeb/m"))
getPaths() # shows where the 4 relevant paths are

times <- list(start = 0, end = 10)

parameters <- list(
  #.progress = list(type = "text", interval = 1), # for a progress bar
  ## If there are further modules, each can have its own set of parameters:
  #module1 = list(param1 = value1, param2 = value2),
  #module2 = list(param1 = value1, param2 = value2)
)
modules <- list("makeLeafletTiles")
objects <- list()
inputs <- list()
outputs <- list()

mySim <- simInit(times = times, params = parameters, modules = modules,
                 objects = objects)

mySimOut <- spades(mySim)
```

## Events

Describe what happens for each event type.

## Plotting

Write what is plotted.

## Saving

Write what is saved.

## Data dependencies

### Input data

How to obtain input data, and a description of the data required by the module. If `sourceURL` is specified, `downloadData("makeLeafletTiles", "path/to/modules/dir")` may be sufficient.

### Output data

Description of the module outputs.

## Links to other modules

Describe any anticipated linkages to other modules.
