initBaseMaps

Steve Cumming

15 October 2016

Overview

Loads, reprojects and crops all initial maps and shapefile required to run LandWeb models.

It is based on the crop module developed by McIntire in 2015.

The present version faciitate testing of the LandWeb neutral fire model.

All the objects to be processes are assumed to already exist in the sim list, having been specified as inputs in any model containing this module.

We assume that a Canada Landcover 2005 (Rasim Latifovic, Richard Fernandes, Darren Pouliot, Ian Olthof 2008) map will exists as `sim$LCC05` and that shapefile `sim$shpStudyRegion` will exist to delineate the study region.

Events

There is only an init event that executes the gis operations.

Usage

```
devtools::install_github("PredictiveEcology/reproducible@development") # require bugfix for one step
library(magrittr) # for %>% pipe
library(SpaDES)
library(raster)
cachePath <- file.path("initBaseMaps", "cache")
modulePath <- Cache(readline, paste0("Where is the module path? (e.g., ~/module, with no quotes).\n",
                                     "Press Enter to accept the path in getPaths()$modulePath: "),
                    cacheRepo = cachePath)
if(nchar(modulePath)==0) modulePath <- getPaths()$modulePath
canadaMap <- Cache(getData, 'GADM', country = 'CAN', level = 1,
                   cacheRepo = cachePath, digestPathContent = FALSE)
dev()
clearPlot()
Plot(canadaMap, speedup = 5, visualSqueeze = 0.9) # 5 seemed optimal
if (!exists("shpStudyRegionFull")) {
  message("Since there is no object called 'shpStudyRegionFull', please draw a study area with 10 points
  severalrandompoints <- Cache(clickCoordinates, 10, cacheRepo = cachePath)
  if (startsWith(attr(severalrandompoints, "tags"), "cache")) message("Taking shpStudyRegionFull from Ca
  shpStudyRegionFull <- SpatialPolygons(list(Polygons(list(Polygon(severalrandompoints$coords)), ID = 1)
                                 proj4string = crs(canadaMap))
}
Plot(shpStudyRegionFull, addTo = "canadaMap", col = "red")
inputDir <- file.path(tempdir(), "inputs") %>% checkPath(create = TRUE)
```

```r
outputDir <- file.path(tempdir(), "outputs")
times <- list(start = 0, end = 10)
parameters <- list()
modules <- list("initBaseMaps")
objects <- list("shpStudyRegionFull" = shpStudyRegionFull,
                "useCache" = TRUE,
                "successionTimestep" = 2)
paths <- list(
  cachePath = cachePath,
  modulePath = modulePath,
  inputPath = inputDir,
  outputPath = outputDir
)
mySim <- simInit(times = times, params = parameters, modules = modules,
                 objects = objects, paths = paths)

simOut <- spades(mySim)
```
